Patients and therapists share their experience using the Frequencer®

## Patient & Therapist Testimonials

*"I am loving the Frequencer®! Just as you predicted, after a couple of treatments something seemed to "click" and now the sessions are very productive. I am using the frequency at 47 and the volume at about 87%-92%, with 5 minutes on each section of lobe and huff coughs in between each section. Have I mentioned I love it? It's so great to be able to "target" my problem lobes and not have to get squeezed and/or hit in order to do it!"*

*A patient*

*"I am absolutely loving my Frequencer®. I have been using it for over a year now and it really has changed my life. Before getting the Frequencer® I was in and out of the hospital at least a few times a year and on and off antibiotics every few weeks. Nothing seemed to be working and I was growing more and more frustrated watching my lung function decline. Since getting the Frequencer® for my home, I haven't been in the hospital and have seen my lung function improve and stabilize. Over the last year, my overall quality of life has drastically improved, and I feel better than I have in a very long time."*

*A patient*

*"I think the Frequencer® is an amazing breakthrough in airway clearance and have found it extremely effective. I really feel that it is making a HUGE difference in my quality of life and health while waiting for my transplant, and at this point every little bit of help in that department is cause for celebration."*

*A patient*

*"I first used the Frequencer® during a hospital stay and could feel right away what a huge difference it made in clearing my airways. After a week or so of using it regularly, I could actually take a deep breath, something I hadn't been able to do in years."*

*A patient*

*"My patient first used the Frequencer® at our CF clinic and then at home. She said it has helped her so much more than the PEP device that she uses and that it resulted in a greater sputum production with each treatment. She also said it was easy to use and she appreciated its quietness – a real plus when you do therapy at odd times (including late at night) and don't want to disturb your apartment neighbors."*

*A therapist*

*“The benefits of this type of therapy are numerous. First, patients are pleased with the autonomy the device provides and how their treatments are not constrained by the schedule of the intervener's availability, as it does not correspond to the patient's period of severe pulmonary congestion. The patient can treat themselves when he or she feels the most need. Second, patients verbalize the fact that they feel more air in their lungs.”*

*“We used the Frequencer® in the treatment of a 17-year-old CF patient whose fev1 < 30%. She also had severe osteoporosis pain and was admitted primarily for this condition at the time. The Frequencer® enabled us to give her comprehensive chest physiotherapy without aggravating her osteoporotic pain.”*

*A therapist*

*“A chest trauma patient with chest tubes, etc. who was on a ventilator at 100% oxygen and 15 cmH2O of PEEP - they were still not able to maintain his oxygen saturation. The doctor asked the staff to do CPT to try and clear his lungs, but did not expect him to last more than 2 or 3 days. The staff did not feel they could do manual CPT due to the patient's frailty and a risk of trauma to the patient. They found the Frequencer® and were immediately able to see that they were clearing his airways without further injuring him. Two weeks later he was still alive and able to have needed surgery. Needless to say, the staff became believers in the Frequencer®.”*

*A therapist*

*“At our Hospital (Montreal, Canada) we are successfully using the Frequencer® with our COVID-19 patients. Indeed, patients are able to produce an effective cough and thus get rid of secretions after using the Frequencer®. We are satisfied with the positive results generated by the Frequencer® and we thank you very much for your support.”*

*Nadine Musampa, pht, MSc*

*“Since using the Frequencer®, we noticed an increase in the amount of mucus collected in patients with significant difficulty expectorating due to lack of coughing strength, thickening of the mucus or for any other physiological reasons. The results were conclusive and allowed us to consider the cessation of clapping treatments for the majority of our patients.”*
